## Abstract

Let 'G' be a graph. If  $u, v \in V$ , then a  $u$ - $v$  geodetic of  $G$  is the shortest path between  $u$  and  $v$ . The closed interval  $I[u, v]$  consists of all vertices lying in some  $u$ - $v$  geodetic of  $G$ . For  $S \subseteq V(G)$  the set  $I[S]$  is the union of all sets  $I[u, v]$  for  $u, v \in S$ . A set  $S$  is a geodetic set of  $G$  if  $I[S]=V(G)$ . The cardinality of minimum geodetic set of  $G$  is the geodetic number of  $G$ , denoted by  $g(G)$ . A set  $S$  of vertices of a graph  $G$  is a split geodetic set if  $S$  is a geodetic set and  $\langle V - S \rangle$  is disconnected, split geodetic number  $g_s(G)$  of  $G$  is the minimum cardinality of a split geodetic set of  $G$ . In this paper I study split restrained geodetic number of a graph. A set  $S$  of vertices of a graph  $G$  is a split restrained geodetic set if  $S$  is a geodetic set and the subgraph  $\langle V - S \rangle$  is disconnected with no isolated vertices. The minimum cardinality of a split restrained geodetic set of  $G$  is the split restrained geodetic number of  $G$  and is denoted by  $g_{sr}(G)$ . The split restrained geodetic numbers of some standard graphs are determined and also obtain the split restrained geodetic number in the Cartesian product of graphs.

**Keywords:** Geodetic set, Geodetic number, Split geodetic set, Split geodetic number, Split Restrained Geodetic set, Split Restrained Geodetic number.

## 1. Introduction

In this paper, we follow the notations of [4]. The graphs considered here have at least one component which is not complete or at least two nontrivial components.

The distance  $d(u, v)$  between two vertices  $u$  and  $v$  in a connected graph  $G$  is the length of a shortest  $u$ - $v$  path in  $G$ . It is well known that this distance is a metric on the vertex set  $V(G)$ . For a vertex  $v$  of  $G$ , the eccentricity  $e(v)$  is the distance between  $v$  and a vertex farthest from  $v$ . The minimum eccentricity among the vertices of  $G$  is radius,  $rad G$ , and the maximum eccentricity is the diameter,  $diam G$ . A  $u$ - $v$  path of length  $d(u, v)$  is called a  $u$ - $v$  geodesic. We define  $I[u, v]$  to be the set of all vertices lying on some  $u$ - $v$  geodesic of  $G$  and for a nonempty subset  $S$  of  $V(G)$ ,  $I[S] = \bigcup_{u, v \in S} I[u, v]$ . A set  $S$  of vertices of  $G$  is called a geodetic set in  $G$  if  $I[S]=V(G)$ , and a geodetic set of minimum cardinality is a minimum geodetic set. The cardinality of a minimum geodetic set in  $G$  is called the geodetic number of  $G$ , and we denote it by  $g(G)$ . The geodetic number of a graph was introduced in [6,7] and further studied in [2,8,4].

A geodetic set  $S$  of a graph  $G=(V, E)$  is a split geodetic set if the induced subgraph  $\langle V - S \rangle$  is disconnected. The split geodetic number  $g_s(G)$  of  $G$  is the minimum cardinality of a split geodetic set. The split geodetic number was introduced and studied in [9].

For any undefined term in this paper, see [3] and [4].

## 2. Preliminary Notes

We need the following results to prove further results.

Theorem 2.1 [2] Every geodetic set of a graph contains its extreme vertices.

Theorem 2.2 [2] For any tree  $T$  with  $k$  end-edges,  $g(T)=k$ .

Theorem 2.3 [2] For any path  $P_n$  with  $n$  vertices,  $g(P_n) = 2$ .

Theorem 2.4 [2] For cycle  $C_n$  of order  $n \geq 3$ ,  $g(C_n) = \begin{cases} 2, & \text{if } n \text{ is even} \\ 3, & \text{if } n \text{ is odd} \end{cases}$

Theorem 2.5 [2] If  $G$  is a nontrivial connected graph, then  $g(G) \leq g(G \times K_2)$ .

## 3. Main Results

Proposition 3.1 For any graph  $G$ ,  $g(G) \leq g_s(G) \leq g_{sr}(G)$ .

Theorem 3.2 For cycle  $C_n$  of order  $n \geq 6$ ,  $g_{sr}(C_n) = \begin{cases} 2 & \text{if } n \text{ is even} \\ 3 & \text{if } n \text{ is odd} \end{cases}$

Proof: Let  $n \geq 6$ , we have the following cases.

Case 1: Let  $n$  be even. Consider  $\{v_1, v_2, \dots, v_{2n}, v_1\}$  be a cycle with  $2n$  vertices and let  $S = \{v_i, v_j\}$  be a split restrained geodetic set of  $C_{2n}$ . For any two antipodal vertices  $v_i$  and  $v_j$ , the shortest  $v_i - v_j$  path includes all the vertices of  $C_{2n}$ . Clearly  $I[S] = V(C_{2n})$ . Also  $x, y \in V - S$ ,  $V - S$  is disconnected with no isolated vertices. Hence  $g_{sr}(C_{2n}) = 2$ .

Case 2: Let  $n$  be odd. Consider  $\{v_1, v_2, \dots, v_{2n+1}, v_1\}$  be a cycle with  $2n+1$  vertices and let  $S = \{v_i, v_j, v_{j+1}\}$  be a split restrained geodetic set of  $C_{2n+1}$ , where  $d(v_i, v_j) = \text{diam}(C_{2n+1})$ . By theorem 2.4 and proposition 3.1, no two vertices of  $S$  forma split restrained geodetic set, so there exists a split restrained geodetic set contains three vertices. Clearly  $I[S] = V(C_{2n+1})$ . Also  $V - S$  is disconnected with no isolated vertices. Hence  $g_{sr}(C_{2n+1}) = 3$ .

Theorem 3.3 For any path  $P_n$ ,  $n \geq 7$ ,  $g_{sr}(P_n) = 3$ .

Proof: Let  $S = \{v_1, v_n, v_i\}$  be a split restrained geodetic set of  $P_n$ , where  $v_1, v_n$  are the two end vertices. By theorem 2.3,  $v_1 - v_n$  path includes all the vertices of  $P_n$  and  $v_i$  is a cut vertex which forms two connected components and for any  $x, y \in V - S$ , such that  $V - S$  is disconnected with no isolated vertices. Thus  $g_{sr}(P_n) = 3$ .

Theorem 3.4 Let  $T$  be a caterpillar that has at least five internal vertices, if  $T$  has  $k$  end-vertices, then  $g_{sr}(T) = k + 1$ .

Proof: Let  $S = \{v_1, v_2, \dots, v_k\}$  be the set containing end-vertices of  $T$  and itself a geodetic set of  $T$  such that  $I[S] = V(T)$ . Let  $\{u_1, u_2, \dots, u_l\} \subset V - S$ . Now  $S' = S \cup \{u_i\}$  is a split restrained geodetic set of  $T$ , where  $u_i \in V - S$  which is a cut vertex which forms connected components. Consider  $P = \{v_1, v_2, \dots, v_k\}$  be a set of end-vertices of  $T$  such that  $|P| < |S'|$  is a geodetic set but  $V - P$  is connected, so  $P$  is not a split restrained geodetic set. Again  $Q = \{u_1, u_2, \dots, u_l\}$  be set of internal vertices of  $T$  such that  $|Q| < |S'|$  is not a geodetic set. Hence it is clear that  $S'$  is a minimum split restrained geodetic set of  $T$ . Also  $x, y \in V - S'$ , such that  $V - S'$  is disconnected with no isolated vertices. Hence  $g_{sr}(T) = k + 1$ .

Theorem 3.5 For any Tadpole graph  $g_{sr}(T_{m,n}) = \begin{cases} 3 & \text{if } m \text{ is even, } n \geq 3, m > 4 \\ 4 & \text{if } m \text{ is odd, } n \geq 3, m > 3 \end{cases}$

Proof: Tadpole graph is a special type of graph consisting of cycle graph of  $m$  vertices and a path graph of  $n$  vertices connected with a bridge.

$V = \{c_1, c_2, \dots, c_m\}$  are the vertices of  $C_m$  and  $U = \{p_1, p_2, \dots, p_n\}$  are the vertices of  $P_n$ .  $W = V \cup U$  are the vertices of tadpole graph.

For  $n \geq 3$ , we have the following cases.

Case 1:  $m$  is even and  $m > 4$

Let  $S = \{p_n, c_i, c_j\}, i < j \leq m$  be a split restrained geodetic set of  $T_{m,n}$ , where  $P_n$  is the end vertex of  $T_{m,n}$  and  $c_i, c_j$  are the antipodal vertices  $C_n$ . Suppose  $S' = \{p_n, c_i\}, |S'| < |S|$ , which is a geodetic set and  $V - S'$  is connected. Hence  $S$  is a minimum split restrained geodetic set. Also for all  $x, y \in V - S$ , it follows that  $V - S$  is disconnected with no isolated vertices. Thus  $g_{sr}(T_{m,n}) = 3$ .

Case 2:  $m$  is odd and  $m > 4$ .

Let  $S = \{p_n, c_i, c_{i+1}\}$  is a geodetic set such that  $I[S] = V(T_{m,n})$ , where  $d(p_n, c_i) = d(p_n, c_{i+1}) = \text{diam}(T_{m,n})$ . Let  $\{c_1, c_2, \dots, c_j, p_1, p_2, \dots, p_{n-1}\} \subset V - S$ . Now  $S' = S \cup \{p_1\}$  or  $S \cup \{c_k\}$  is a split restrained geodetic set of  $T_{m,n}$ , where  $p_1$  or  $c_k \in V - S$  which is a cut vertex which forms connected components. Hence it is clear that  $S'$  is a minimum split restrained geodetic set of  $T_{m,n}$ . Also  $x, y \in V - S'$  it follows that  $V - S'$  is disconnected with no isolated vertices. Hence  $g_{sr}(T_{m,n}) = 4$ .

Theorem 3.6 For Banana tree graph  $g_{sr}(B_{n,k}) = n(k - 2) + 1$ .

Proof: Let  $S = \{v_1, v_2, \dots, v_{nk-2n}\}$  be the set containing end-vertices of  $B_{n,k}$  and itself a geodetic set of  $B_{n,k}$ , such that  $I[S] = V(B_{n,k})$ . Let  $S' = S \cup \{u\}$  is a split restrained geodetic set of  $B_{n,k}$ , where  $u \in V - S$  is a root vertex. Consider  $P = \{v_1, v_2, \dots, v_{nk-2n}\}$  be a set of end vertices of  $B_{n,k}$  such that  $|P| < |S'|$  is a geodetic set but  $V - P$  is connected, so  $P$  is not a split restrained geodetic set. Again  $Q = \{u, u_1, u_2, \dots, u_l\}$  be set of internal vertices of  $B_{n,k}$  such that  $|Q| < |S'|$  is not a geodetic set. Hence it is clear that  $S'$  is a minimum split restrained geodetic set of  $B_{n,k}$ . Also  $x, y \in V - S'$ , such that  $V - S'$  is disconnected with no isolated vertices. Hence  $g_{sr}(B_{n,k}) = n(k - 2) + 1$ .

#### 4. Adding an End-Edge

For an edge  $e = (u, v)$  of a graph  $G$  with  $\text{deg}(u) = 1$  and  $\text{deg}(v) > 1$ , we call  $e$  an end-edge and  $u$  an end-vertex.

Theorem 4.1 For the Helm graph  $H_n, n \geq 6, g_{sr}(H_n) = n + 3$ .

Proof: Let Helm graph  $H_n$  is a graph obtained from the wheel graph by attaching an end-edge at each vertex of the  $n$ -cycle of the wheel.

Let  $V(H_n) = \{x, u_1, u_2, \dots, u_n, v_1, v_2, \dots, v_n\}$  where  $\text{deg}(x) = n, \text{deg}(v_i) = 1$  and  $\text{deg}(u_i) = 4$  for each  $i \in \{1, 2, \dots, n\}$ .

Let  $S = \{v_1, v_2, \dots, v_n, x\}$  be the set of  $n$ -end vertices of  $H_n$  and a vertex of degree  $n$  is a geodetic set of  $H_n$  such that  $I[S] = V(H_n)$ . Let  $\{u_1, u_2, \dots, u_n\} \subset V - S$ . Now  $S' = S \cup \{u_i, u_j\}$  is a split restrained geodetic set of  $H_n$ , where  $u_i, u_j \in V - S$  which are cut vertices forms connected components. Consider  $P = \{v_1, v_2, \dots, v_k, x\}$  be a set of end vertices and a vertex of degree  $n$  of  $H_n$  such that  $|P| < |S'|$  is a geodetic set but  $V - P$  is connected, so  $P$  is not a split restrained geodetic set, again  $Q = \{u_1, u_2, \dots, u_n\}$  be the vertices of the cycle of  $H_n$ , such that  $|Q| < |S'|$  is not a geodetic set. Hence it is clear that  $S'$  is the minimum split restrained geodetic set of  $H_n$ . Also  $x, y \in V - S'$ , it follows that  $V - S'$  is disconnected with no isolated vertices. Hence  $g_{sr}(H_n) = n + 3$ .

**Theorem 4.2** Let  $G'$  be the graph obtained by adding an end-edge  $(u_i, v_i)$ ,  $i=1, 2, \dots, n$  to each vertex of cycle  $C_n = G$  for  $n \geq 6$ , such that  $u_i \in G, v_i \notin G$ , then  $g_{sr}(G') = n + 2$ .

**Proof:** Let  $G = C_n = \{u_1, u_2, \dots, u_n, u_1\}$  be a cycle with  $n$  vertices. Let  $G'$  be the graph obtained by adding an end-edge  $(u_i, v_i)$ ,  $i = 1, 2, \dots, n$  to each vertex of  $G$  such that  $u_i \in G, v_i \notin G$ . Clearly  $X = \{v_1, v_2, \dots, v_n\}$  is the  $n$  number of end-vertices of  $G'$ . Let  $S = X \cup \{u_i, u_j\}$  be a split restrained geodetic set of  $G'$ , where  $u_i, u_j$  are cut vertices which forms connected components. Thus  $I[S] = V(G')$ . Also  $x, y \in V - S$ , such that  $V - S$  is disconnected with no isolated vertices, thus  $g_{sr}(G') = n + 2$ .

**Theorem 4.3** Let  $G'$  be the graph obtained by adding  $k$  end-edges  $\{(u, v_1), (u, v_2), \dots, (u, v_k)\}$  to a cycle  $C_n = G$  of order  $n \geq 6$ , with  $u \in G$  and  $\{v_1, v_2, \dots, v_k\} \notin G$ .

Then  $g_{sr}(G') = \begin{cases} k + 2 & \text{for even cycle} \\ k + 3 & \text{for odd cycle} \end{cases}$

**Proof:** Let  $G = C_n = \{u_1, u_2, \dots, u_n, u_1\}$  be a cycle with  $n$  vertices and let  $G'$  be the graph obtained from  $G = C_n$  by adding  $k$  end-edges  $\{(u, v_1), (u, v_2), \dots, (u, v_k)\}$  for fixed  $u \in G$  and  $\{v_1, v_2, \dots, v_k\} \notin G$ . We have the following cases.

**Case 1:** Let  $G = C_{2n}, n > 2$ . Consider  $S = \{v_1, v_2, \dots, v_k\} \cup \{u_i\}$ , for any vertex  $u_i$  of  $G$ . Now  $S' = S \cup \{u\}$  be a split restrained geodetic set,  $\{v_1, v_2, \dots, v_k\}$  are the end-vertices of  $G'$  and  $u, u_i$  are antipodal vertices of  $G$ , thus  $I[S'] = V(G')$ . Consider  $P = \{v_1, v_2, \dots, v_k\}$  as a set of end-vertices such that  $|P| < |S'|$  is not a geodetic set, that is for some vertex  $u_i \in V(G)$ ,  $u_i \notin I[P]$ . If  $P = S$ , then  $P$  is not split restrained geodetic set. Thus  $S'$  is the minimum split restrained geodetic set. Then  $V - S'$  is an induced subgraph which has more than one connected component. Thus  $g_{sr}(G') = k + 2$ .

**Case 2:** Let  $G = C_{2n+1}, n > 3$ . Consider  $S = \{v_1, v_2, \dots, v_k\} \cup \{u_i, u_{i+1}\}$  for any adjacent vertices  $u_i, u_{i+1} \in G$ . Now  $S' = S \cup \{u\}$  be a split restrained geodetic set, such that  $\{v_1, v_2, \dots, v_k\}$  are the end-vertices of  $G'$  and  $d(u, u_i) = d(u, u_{i+1}) = \text{diam}(G)$ . Thus  $I[S'] = V(G')$ . For any  $x, y \in V - S'$ , it follows that  $V - S'$  is disconnected with no isolated vertices. Thus  $g_{sr}(G') = k + 3$ .

## 5. Cartesian Product

The Cartesian product of the graphs  $H_1$  and  $H_2$ , written as  $H_1 \times H_2$ , is the graph with vertex set  $V(H_1) \times V(H_2)$ , two vertices  $(u_1, u_2)$  and  $(v_1, v_2)$  being adjacent in  $H_1 \times H_2$  if and only if either  $u_1 = v_1$  and  $(u_2, v_2) \in E(H_2)$ , or  $u_2 = v_2$  and  $(u_1, v_1) \in E(H_1)$ .

**Theorem 5.1** For any cycle  $C_n$  of order  $n$ ,  $g_{sr}(K_2 \times C_n) = \begin{cases} 4 & \text{if } n \text{ is even} \\ 5 & \text{if } n \text{ is odd, } n > 3 \end{cases}$

**Proof:** Consider  $G = C_n$ , Let  $K_2 \times C_n$  be a graph formed from two copies  $G_1$  and  $G_2$  of  $G$ . Let  $V = \{v_1, v_2, \dots, v_n\}$  be the vertices of  $G_1$  and  $W = \{w_1, w_2, \dots, w_n\}$  be the vertices of  $G_2$ .  $U = V \cup W$ . We have the following cases.

**Case 1:** Let  $n$  be even. Consider  $S = \{v_i, w_j\}$  is a geodetic set of  $K_2 \times G$  such that  $v_i - w_j$  path is equal to  $\text{diam}(K_2 \times G)$ , which includes all the vertices of  $K_2 \times G$ . Let  $S' = \{v_i, w_i, v_j, w_j\}$ , where  $(v_i, w_i), (v_j, w_j) \in E(K_2 \times G)$ . Now  $U - S'$  is an induced subgraph which is disconnected but no isolated vertices. Hence  $g_{sr}(K_2 \times G) = 4$ .

**Case 2:** Let  $n$  be odd. Consider  $S = \{v_i, w_j, v_k\}$  is the geodetic set of  $K_2 \times G$  such that  $d(v_i, w_j) = \text{diam}(K_2 \times G) = d(w_j, v_k)$ . Thus  $I[S] = U(K_2 \times G)$ . Let  $S' = \{v_i, w_i, v_j, w_j, v_k\}$ , where

$(v_i, w_i), (v_j, w_j) \in E(K_2 \times G)$ . Now  $U - S'$  is an induced subgraph which is disconnected with no isolated vertices. Hence  $g_{sr}(K_2 \times G) = 5$ .

**Theorem 5.2** For any path  $P_n$  of order  $n > 3$ ,  $g_{sr}(K_2 \times P_n) = 4$ .

**Proof:** Consider  $G = P_n$ . Let  $K_2 \times P_n$  be a graph formed from two copies  $G_1$  and  $G_2$  of  $G$ . Let  $V = \{v_1, v_2, \dots, v_n\}$  be the vertices of  $G_1$ ,  $W = \{w_1, w_2, \dots, w_n\}$  be the vertices of  $G_2$  and  $U = V \cup W$ . Let  $n > 3$ . If  $S = \{v_i, w_j\}$  is a geodetic set of  $K_2 \times P_n$  where  $d(v_i, w_j) = \text{diam}(K_2 \times P_n)$ . Let  $S' = S \cup \{v_{i+1}, w_{j+1}\}$ , Now  $U - S'$  is an induced subgraph which is disconnected with no isolated vertices. Hence  $g_{sr}(K_2 \times P_n) = 4$ .

**Theorem 5.3** For any complete graph of order  $n > 3$ ,  $g_{sr}(K_2 \times K_n) = n$ .

**Proof:** Let  $G_1$  and  $G_2$  be disjoint copies of  $G = K_n, n > 3$ . Let  $V = \{v_1, v_2, \dots, v_n\}$  and  $W = \{w_1, w_2, \dots, w_n\}$  be the vertex sets of  $G_1$  and  $G_2$ , respectively. Let  $S$  be a minimum geodetic set of  $K_2 \times K_n$ . Without loss of generality, we may assume that  $v_1 \in S$ . Since  $d(v_1, w_j) = 2 = \text{diam}(K_2 \times K_n)$  for each  $j = \{2, 3, \dots, n\}$ ,  $\{w_j | 2 \leq j \leq n\} \subseteq S$ . So  $g(K_2 \times K_n) \geq n$ , and thus  $g_{sr}(K_2 \times K_n) \geq n$ . Since  $\{v_1\} \cup \{w_j | 2 \leq j \leq n\}$  forms a split restrained geodetic set of  $K_2 \times K_n$ ,  $g_{sr}(K_2 \times K_n) \leq n$ . Thus  $g_{sr}(K_2 \times K_n) = n$ .
