Abstract

The banking sector plays a vital role in the development of any country's economy. India's Central Bank (RBI), commercial banks, cooperative bank, and development banks comprise India's banking system. In the banking sector, non-performing assets (NPAs)play a pivotal role serving as indicators of asset quality and financial health of banks. These are loans or advances that have ceased to generate income for the bank due to default by the borrower. The presence of NPAs can significantly impact a bank's profitability, solvency, and overall stability. It necessitates prudent risk management practices, strategic restructuring efforts, and effective resolution mechanisms to mitigate adverse consequences. Addressing NPAs is crucial for sustaining the integrity of the banking sector, ensuring the efficient allocation of capital, and fostering economic growth by maintaining a sound and resilient financial environment. This article attempts to study an existing literature on NPA by reviewing fifty articles and thus highlight the root causes of NPAs, their economic implications, and suggests viable remedial measures to mitigate the rising NPA crisis. This research work may propose a roadmap for future research and policy considerations, emphasizing the urgency of collaborative efforts to fortify the resilience of Indian banks and foster sustainable financial health.

Keywords: Non-Performing Assets (NPA), financial health, banking sector, profitability, solvency.

Introduction

Non-performing assets (NPA) are an extension of NPA. Any advance or loan that is past due by more than ninety days is classified as a non-performing asset in India's Central Bank (RBI)

As per the RBI circular from 2007, "an asset becomes non-performing when it ceases to generate income for the bank."

The 90-day overdue standard for identifying non-performing assets (NPAs) was introduced by the RBI in order to better align with global practices. It became effective for the year that ended on March 31, 2004. Non-performing assets also come in several varieties, depending on how long they have been nonperforming assets (NPAs).

What do a bank's nonperforming assets and assets mean?

All that is owned is considered an asset. All that is owned is considered an asset.

Because the interest we pay on these loans is one of the bank's main sources of income, a loan considered as an asset by the bank, becomes "non-performing" when consumers, whether corporate or retail, are inadequate to pay the interest since the asset is not propagate any revenue for the bank. NPAs, then, are

assets that no longer bring in money for the RBI.

Objective of Study

- A. To examine NPA patterns and trends in Indian banks.
- B. To determine the main causes of the growth in non-performing assets.
- C. To evaluate NPAs' effects on the Finance industry.
- D. To assess the logicality of current regulatory and policy frameworks
- E. To provide plans for the efficient handling and resolution of underperforming assets in Indian banks

Methodology

Data collection

- Data is collected through details found in R.B.I report regarding non-performing assets in Indian banks.
- Details regarding amount of N.P.A, factors behind large amount of N.P.A in Indian banks and steps taken by R.B.I from news portals such as Economic times, Business standard, money control

Statistical tools:

Descriptive statistics, regression analysis, and temporal trend analysis are used to identify the main drivers of NPAs of Indian banks and discovering that high levels of NPAs have resulted in lower profitability,

increased provisioning requirements, and higher borrowing costs.

Source of data:

- 1. The information received is in secondary in nature.
- 2. The major data received is from the report of Reserve Bank of India.
- 3. Data have been collected from news articles of news portals such as
- 4. Economic times, money control, The Hindu, Business standard

Data and Sample Selection:

The information has been gathered over a span of five years, from 2018 to 2022, to assess the trend of Non-Performing Assets (NPAs) in chosen banks. The analysis indicates a consistent rise in NPAs within these banks over the mentioned timeframe. To facilitate understanding, a comparative statement has been formulated to illustrate the percentage increase of NPAs across the selected banks. The figures detailing the gross and net non-performing assets of specific banks from 2018 to 2022 are provided below. (Table 1, 2)

The data includes selected public and private banks with the highest turnover, chosen on the basis that banks with higher turnovers tend to have more Non-Performing Assets (NPAs). It's a well-known fact that NPAs are generally higher in Public Sector Banks (PSBs) compared to private banks. Therefore, three private banks and two PSBs were selected to minimize the disparity between bank categories. It's noteworthy that NPAs are predominantly concentrated in PSBs and private banks. Foreign banks, cooperative banks, and other bank categories typically have very few NPAs.

The tables present NPAs figures for the selected banks from the fiscal years 2017-2018 to 2021-2022. Table 1 displays the gross NPAs figures, while Table 2 presents the net NPAs figures. Notably, public sector banks like S.B.I and B.O.I. exhibit higher NPAs compared to private banks like HDFC and ICICI Bank. Over time, there has been a decrease in net NPAs across all banks, indicating the acceptance of hypothesis H02.

Findings:

From the reviews of articles, it is established that the main reasons behind NPA are Economic inadequate risk management procedures, fraudulent activity, political meddling, unstable global finance, high interest rates, excessive leverage, and legal or regulatory changes of the Proactive risk management, strict lending guidelines, efficient monitoring, and recovery techniques are needed to deal with non-performing assets (NPAs).

The gross non-performing assets (GNPA) decreased from 3.9% in March 2023 to 3.2% in September 2023.

All the major industries have shown a general improvement in their GNPA ratios. Nevertheless, the agriculture sectors GNPA ratio remained high at 7%. The number of banks and NBFCs has grown significantly during the last two years. But as of September 2023, the GNPA ratio for personal loans has started to level down. Higher GNPA levels, however, are observed in consumer loans for credit card receivables, especially for foreign banks (FB). NPAs in the housing industry have been comparatively constant despite increased rates.

Suggestions:

Stringent guidelines must be adhered to during the loan approval process. Sufficient security or guarantees must be obtained to ensure maximum recovery in the event of default. Prompt legal measures should be staken against deliberate defaulters. Timely and rigorous implementation of policies outlined by the R.B.I. to mitigate Non-Performing Assets (NPAs) is essential. Each bank should designate a specialized team for NPA recovery. Loans should not be granted based solely on referrals or references without adequate collateral or pledges.

Conclusion:

To mitigate the issue of Non-Performing Assets (NPA)it is recommended to strengthen regulatory monitoring, enhance risk management frameworks, promote openness and accountability, and encourage proactive actions such asset reconstruction and resolution procedures. Furthermore, in the long run, actions to revitalize distressed industries and advance financial inclusion, along with the cultivation of a culture of responsible lending and borrower discipline, can support sustainable nonperforming asset management. The aggregate results indicate a concerning state of affairs for the banking industry at large. The issue is apparent not just with small-sized banks but also with well-known brands in the banking industry,

according to an examination of the increase rate in the NPA level. Therefore, the crisis has engulfed the entire industry. The RBI's guidelines force banks to set aside a certain amount based on the quality of their assets, which makes them less profitable. This is why the banks' poor asset quality is an issue
